Amendments to the Specification

Please amend the above-identified application as follows:

At page 1, starting at line 19, please delete the current paragraph and replace it with the following

paragraph:

[0004] Most document production is achieved without using any kind of structure or automation. In order to

improve the efficiency of the document production process varying degrees of automation are available.

Current electronic typesetting and document layout and publishing systems for printing and/or electronic

publishing offer automation features that utilise utilize different types of data to produce a completed work.

The content is generally produced separately from the design or stylistic content which gives the finished

work a particular appearance. This appearance may be common to a group of works across a series, lending

the series a consistent format that is often designed to appeal to potential purchasers.

At page 6, starting at line 3, please delete the current paragraph and replace it with the following

paragraph:

[0019] Some document automation systems utilise utilize software that augments the function of page layout

applications such as QuarkXPress, Adobe PageMaker, or Adobe InDesign to allow them to function as

database publishing systems. These systems are limited to highly structured data and have limited ability to

deal with any variability in data length or appearance.

At page 20, starting at line 24, please delete the current paragraph and replace it with the following

paragraph:

[0074] When the design data set 130 is created before the content data set 110 there can be a flow of

information from the Designer application to the content creation application shown by the arrow linking

blocks 100 and 120. The information passed between them may include details of the defined paragraph styles

and page-view element formats such as the paragraphs or other information that needs to be included in a

particular element such as a sidebar, table or figure. In this way, the content creator or editor of the content

data set 110 is able to indicate that certain paragraphs in the text are to be treated in a particular way.

However, he or she does not need to be aware of the overall style of the finished work, merely that he or she

wishes a certain block of text to be placed in a sidebar, for instance. In the case where a design data set is not

Page 2

Attorney Docket No.: TYPE-01000US0

created before the content data set, the content creator may utilize a DTD or schema to provide the

structural information related to their content. We refer to this as upstream structural flow. Content does not

need to be created using this process, but it offers certain benefits specific to the invention.

At page 30, starting at line 15, please delete the current paragraph and replace it with the following

paragraph:

[00103] The effect of the dependencies is that if the position of any single component shifts, then the

position of any component which depends on the altered position, either directly or indirectly, is also altered

automatically according to the defined relationships. Although not illustrated, spatial dependencies may also

be defined to apply on a horizontal level so that widths or left/right positions from one frame become the basis

of another in the same manner that the heights and vertical positions can be made dependent. Using this

method the design of an element can be automatically adjusted to suit the content. In the case where a number

of different designs are provided for the same element it is further possible to trigger the automatic

progression from one design of that element to another when a specified parameter is exceeded such as a

frame height within one of the related element designs exceeding a certain limit. This will allow the content to

be formatted according to the alternative element design. For example, the text of an element that in the first

instance would usually occupy just one column across a two-column page design may be retargeted at an

element that utilises utilizes a two-column design if the text causes a frame to exceed a certain extent such as,

for example, the vertical height of the page's primary text frame.

At page 43, starting at line 1, please delete the current paragraph and replace it with the following

paragraph:

[00133] The second iteration attempts to place the first five elements according to the first rule, and the

sixth element according to the second rule. Again, this layout is scored and stored. The third iteration attempts

to place the first five elements according to the first rule, and the sixth element according to the third rule. The

position of element anchors may move during the layout process due to the impact of placed elements in

relation to the body text. The latest positional information and the effects a layout has on the body text flow

are utilised by the layout engine each time an element is placed on the page. This allows the layout rules to

adapt to the latest instance of a page composition as the page is composed. In some instances elements that

were initially included in the potential layouts may be dropped from the page design by the engine due to the

Page 3

conditions of their original inclusion no longer being valid. Once the layout has been completed for every

valid element the layout is scored and stored.

At page 52, starting at line 19, please delete the current paragraph and replace it with the following

paragraph:

[00169] The foregoing detailed description of the invention has been presented for purposes of

illustration and description. It is not intended to be exhaustive or to limit the invention to the precise form

disclosed. Many modifications and variations are possible in light of the above teaching. The described

embodiments were chosen in order to best explain the principles of the invention and its practical application

to thereby enable others skilled in the art to best utilize utilize the invention in various embodiments and with

various modifications as are suited to the particular use contemplated. It is intended that the scope of the

invention be defined by the claims appended hereto.
